# What is CAN – General Aspects

• Serial Network Technology for Embedded Solutions

- Originally designed by Bosch for automotive industry
- Became very popular in industrial automation

- **OPPERHILL** technologies
- Network technology established among micro-controllers
- Well suited for high speed/real-time applications
- Replaces expensive Dual-Port RAM technology
- CAN chips manufactured by Motorola, Philips, Intel, Infineon, and more
- 600 Million CAN nodes used in 2007

# What is CAN – Technical Aspects

- High-integrity serial data communications bus for real-time applications
- Designed for max. performance & reliability
- Operates at data rates up to 1 Mbit/sec
- Uses short messages 8 bytes per message
- Excellent error detection and fault confinement capabilities
- Is an international standard: ISO 11898

 $\ensuremath{\mathbb{C}}$  Copperhill Technologies Corp.  $\bullet$  https://copperhilltech.com

# A Brief History of CAN - 1

- 1983 Start of Bosch internal project to develop in-vehicle network
- 1986 Official introduction of the CAN protocol
- 1987 First CAN controller chips by Intel & Philips
- 1991 Bosch publishes CAN specification 2.0
- 1992 CAN in Automation (CiA) established
- 1992 CAN Application Layer (CAL) protocol by CiA
- 1992 First automobiles equipped with CAN (Mercedes Benz)
- 1993 ISO 11898 standard published
- 1994 First International CAN Conference (iCC)
  - 1994 Allen Bradley introduces DeviceNet
  - 1995 ISO 11898 amendment (extended frame format)
  - 1995 CANopen protocol introduced
  - 2000 Development of time-triggered CAN

Controller Area Network Serial Network Technology for Embedded Solutions

# A Brief History of CAN - 2

### Number of Million CAN Nodes sold:

# CAN is used wherever two or more microprocessor units need to communicate with each other.

- Passenger Cars (multiple separate CAN networks)
- Trucks & Buses, Construction Vehicles, Agricultural Vehicles (SAE J1939 protocol)
- Semiconductor Industry (Wafer Handlers, etc.)
- Robotics, Motion Control Applications
- Passenger/Cargo Trains (Brake Control, Wagon Communication)
- Aircrafts (AC, Seat Adjustment)
- Elevators (e.g. Otis)
- Building Technologies (Light & Door Control Systems, Sensors, etc.)
- Medical Equipment (X-Ray, CAT scanners, etc.)
- Household Utilities (Coffee Machine, Washer, etc.)
- Aerospace (Satellites)

# CiA – CAN in Automation

- International Users and Manufacturers Organization
- Develops, supports CAN Standards and CAN based higher layer protocols
- All activities are based on CiA members' interest

### http://www.can-cia.org

### **CAN Newsletter**

To subscribe log on to:

https://can-newsletter.org/newsletter

- Multi-Master Bus Access
- Message Broadcasting
- Message Priority (No Node IDs)
- Limited Data Length (0...8 bytes)
- 1 Mbit/sec Data Rate
- Excellent Error Detection & Fault Confinement

- SW Development Engineer is not involved with writing protocol features
- Low Cost Implementation

**Controller Area Network** 

Be aware! Whenever you attempt to add software functions between the CAN Data Link Layer and the Application Layer, you will be adding functionalities that are already covered by off-the-shelf available higher layer protocols such as CANopen and DeviceNet.

# Message Frames

• Data Frame – Broadcasts a message to the CAN bus

Bus Idle	S O F	Arbitration Field	Control Field	Data Field	CRC Field	ACK Field	EOF	IFS	Bus Idle
-------------	-------------	----------------------	------------------	------------	--------------	--------------	-----	-----	----------

• **Remote Frame** – Requests transmission of message

Bus Idle	S O F	Arbitration Field	Control Field	CRC Field	ACK Field	EOF	IFS	Bus Idle
-------------	-------------	----------------------	------------------	--------------	--------------	-----	-----	----------

• Error Frame – Signals error condition

Error Condition Occurs								
Uncompleted Frame	6 Bits	06 Bits	8 Bits	3 Bits	Retransmission			
	Error Flag		Error Delimiter					
	•	Error Fran 1420 B	ne its	Interframe Space				

• Overload Frame – Special Error Frame

# Controller Area Network

# Serial Network Technology for Embedded Solutions

# **Remote Transmission Request**

### • Data Frame – Broadcasts a message to the CAN bus

### • Remote Frame – Requests transmission of message

# Message Broadcasting with Data Frames

- Node A transmits a message
- Nodes B, C and D receive the message
- Nodes B and D accept the message, Node C declines

Message Request with Remote Frames - 1

- Node A sends a remote frame (request)
- Node B, C, D receive message
- Node D accepts, Nodes B & C decline message

# Message Request with Remote Frames - 2

- Node D sends requested message
- Nodes A, B, C receive requested message
- Nodes A, B accept requested message, Node C declines

# Message Frame Format - 1

### • Data Frame

Bus Idle	S O F	Arbitration Field	Control Field	Data Field	CRC Field	ACK Field	EOF	IFS	Bus Idle
-------------	-------------	----------------------	------------------	------------	--------------	--------------	-----	-----	----------

### Remote Frame

Bus Idle	S O F	Arbitration Field	Control Field	CRC Field	ACK Field	EOF	IFS	Bus Idle
-------------	-------------	----------------------	------------------	--------------	--------------	-----	-----	----------

### • Error/Overload Frame

## Message Frame Format - 2

© Copperhill Technologies Corp. • https://copperhilltech.com

**Controller Area Network** 

### • Standard Format: 11 Bit Message Identifier

• Extended Format: 29 Bit Message Identifier

- Both formats, Standard and Extended, may co-exist on the same CAN bus
- The distinction between both formats is managed by "Identifier Extension Bit" (IDE)

# **Controller Area Network**

Serial Network Technology for Embedded Solutions

# **Dominant/Recessive Bus Level**

### Node Output and Resulting Bus Level

# Beit Monitoring

- Each transmitting node monitors the Bit level on the bus, compares it to transmitted level.
- Used during arbitration process.

**Controller Area Network** 

**DPERHILL** technologies

• Provides immediate detection of all bus-wide and local transmission errors.

# Controller Area Network

Serial Network Technology for Embedded Solutions

# **Bus Arbitration Principle - 2**

© Copperhill Technologies Corp. • https://copperhilltech.com

Controller Area Network Serial Network Technology for Embedded Solutions

Ð

# **Bus Arbitration Principle - 3**

### **Main Rules of Bus Arbitration**

- Bus is considered idle after transmitted message plus Intermission Field
- Node that transmits message with lowest ID (highest priority) wins arbitration, continues to transmit. Competing nodes switch to receiving mode.

 Nodes that lost arbitration will start new arbitration as soon as bus is free for access again => No message gets lost

# Data Transfer Synchronization - 1

### **Bit Coding**

• Bit coding according to Non-Return-to-Zero principle

- NRZ provides highest transport capacity
- Constant Bit level over Bit time
- Insufficient signal edges for synchronization of Bit stream
- "Bit Stuffing" required

**PPERHILL** technologies

# Data Transfer Synchronization - 2

### Bit Stuffing

- Sender inserts complementary Bit ("Stuff Bit") after 5 successive Bits of same polarity
- Receiver filters the complementary Bit

- 1. Bit sequence to be transmitted
- 2. Transmitted Bit sequence on bus after bit stuffing
- 3. Bit sequence at receiver after filtering Stuff Bit

# Data Transfer Synchronization - 3

### **Bit Stuffing**

- Provides additional signal edges for data synchronization
- No Bit Stuffing in static format fields of message frame
- Special case: Stuff Bit contributes to 5 Bit sequence

### Further Bit Synchronization through

- Programmable Phase Buffers
- Resynchronization Jump Width

 $\ensuremath{\mathbb{C}}$  Copperhill Technologies Corp.  $\bullet$  https://copperhilltech.com

Bus Idle

# Frame Length Due to Bit Stuffing

• Frame length varies due to bit stuffing

	Data Field 0 Bytes	Data Field 8 Bytes
No bit stuffing	47 bits	111 bits
Max. bit stuffing (worst case scenario)	55 bits	135 bits
Average bit stuffing	49 bits	114 bits

- Based on 11-Bit Identifier
- Average bit stuffing determined per mathematical model

**Controller Area Network** 

Serial Network Technology for Embedded Solutions

# Bit Monitoring - 1

• When exactly does a receiving CAN node read the bit information ?

Bit Rate [kBit/ sec]	Nominal Bit-Time [µsec]
1000	1
500	2
250	4
125	8

# Bit Monitoring - 2

### • Partitioning of CAN Bit Time into Four Segments

**Sync\_Seg:** Signal edge is expected here. Any deviation will affect Phase Buffer lengths.

**Prop\_Seg:** Compensates for signal propagation times within the network.

**Phase\_Seg1/2:** Compensate for signal edge phase errors by adjusting their length.

**Resynchronization Jump Width:** Defines the upper limit to adjust phase buffer lengths.

# Hard Synchronization

- Hard Synchronization at Start of Frame (SOF)
- Resets internal timing of receiving node

Controller Area Network Serial Network Technology for Embedded Solutions

# **Bit Synchronization**

- Bit Synchronization within a frame
- Phase\_Seg1 and Phase\_Seg2 correct position of bit sample point according to phase error

## **Phase Errors**

**OPPERHILL** technologie

S

Controller Area Network Serial Network Technology for Embedded Solutions

# **Error Detection Method**

### • Bit Monitoring

Each transmitting node monitors the Bit level on the bus, compares it to transmitted level. Provides immediate detection of all bus-wide and local transmission errors.

### • Stuff Error

More than 5 Bits of same polarity outside of "bit-stuffed" segment

### CRC Error

Comparison of received CRC sequence and calculated CRC. Provides detection of local receiver errors.

# **OPPERHILL** technologie

### • Form Error

Violation of fixed format Bit fields

### Acknowledgement Error

Transmitted message receives no acknowledgement. ACK confirms only the successful transmission. Is used for error confinement.

# **Error Detection Analysis**

Probability of non-detected faulty CAN messages

### **Example:**

- 1 Bit error each 0.7 sec
- 500 kBit/sec
- 8 h/day
- 365 days/year

**Residual Error Probability :** 

1 undetected error in 1000 years

# **Error Detection**

### **Error Frame**

**Controller Area Network** 

Serial Network Technology for Embedded Solutions

**DPERHILL** technologies

### **Basic Error Frame**

### More "realistic" Error Frame

Error Recovery Time = Error Flag + Error Delimiter + Intermission Field = 12 + 8 + 3 = 23 Bits

# **Error Frame Super Positioning**

**Controller Area Network** 

Serial Network Technology for Embedded Solutions

**es** 

**PPERHIL** technolog

- Guarantees proper network operation even in cases where malfunctioning nodes produce continuous error condition
- CAN error detection can pinpoint to "perpetrator"
- Distinction between temporary and permanent node failures
- Identification and removal (self-retirement) of malfunctioning nodes from the bus

### **Possible error scenarios in a CAN network:**

### 1. Transmit Error

- A transmitting node sends a faulty message
- ALL receiving nodes in the network respond with an error frame
- Through "majority vote" the transmitting node is being flagged as the "perpetrator"

### **2. Receive Error**

- A transmitting node send a perfectly good message
- Only ONE node in the network responds with an error frame
- Through "majority vote" the error reporting node is being flagged as the "perpetrator"

**Controller Area Network** 

Serial Network Technology for Embedded Solutions

# Fault Confinement - 2

### **CAN Node Error States**

**REC: Receive Error Counter TEC:** Transmit Error Counter

# **Bus Medium**

 Physical media must support "dominant" and "recessive" bus level. Dominant level always overrules recessive level, especially during bus arbitration.

**Controller Area Network** 

Serial Network Technology for Embedded Solutions

Two-wire bus terminated with line impedance to avoid signal reflections

# **Bus Topology**

Bus Topology according to ISO 11898

# Controller Area Network

Serial Network Technology for Embedded Solutions

# **OPPERHILL** technologies

# Wiring and Connections

Pin	Signal	Description
1	-	Reserved
2	CAN_L	CAN_L bus line (dominant low)
3	CAN_GND	CAN Ground
4	-	Reserved
5	CAN_SHLD	Optional CAN shield
6	GND	Optional CAN Ground
7	CAN_H	CAN_H bus line (dominant high)
8	-	Reserved (error line)
9	CAN_V+	Optional CAN external positive supply

# **CAN Controller Chips - 1**

Two different types of CAN applications:

- Stand-Alone CAN Controller
- Microprocessor with integrated CAN Controller

Many major semiconductor manufacturers, such as Motorola, Philips, Intel, Infineon, and many more, sell CAN chips.

Most semiconductor manufacturers who usually integrated a UART with their microprocessor design, in order to support serial communication for RS 232/485, nowadays tend to integrate CAN instead.

# CAN Controller Chips - 2

### **Basic CAN**

- One receive, one transmit message FIFO buffer
- Low cost solution
- Requires good CPU performance or low CAN data traffic

Controller Area Network

Serial Network Technology for Embedded Solutions

### **Full CAN**

- Several programmable receive and/or transmit message buffers
- Most designs also provide Basic CAN features
- Allows low CPU performance or high CAN data traffic

# Higher Layer Protocols - 1

Why Higher Layer Protocols...?

Controller Area Network

Serial Network Technology for Embedded Solutions

**PPERHILL** technologies

- Data Transport of more than 8 bytes
- Embedded Systems require appropriate communication model based on Master/Slave configuration
- Network Management (Network Start-Up, Node Monitoring, Node Synchronization, etc.)

# Higher Layer Protocols - 2

### CANopen

- Suited for embedded applications
- Was originally designed for motion control
- Developed/Maintained by CAN-in-Automation User Group
- Manufacturer-Independent Protocol

http://www.can-cia.org

### DeviceNet

- Suited for industrial applications (floor automation)
- Developed by Allen Bradley/Rockwell
- Maintained by Open DeviceNet Vendor Association (ODVA)
- Standard "controlled" by Allen Bradley/Rockwell

http://www.odva.org

### SAE J 1939

- Communication for vehicle networks (trucks, buses, etc.)
- Standard developed by Society of Automotive Engineers (SAE)

http://www.sae.org

 $\ensuremath{\mathbb{C}}$  Copperhill Technologies Corp.  $\bullet$  https://copperhilltech.com
